Although complications related to procedures in the Cath lab are rare they can creep up on us with catastrophic consequences.

Sometimes human nature obstructs the process of getting the best out of the considerable expertise working in such a unique environment.

The aims of the CLEMS course are:

- To re-familiarise staff in providing the core resus skills required to support the critically ill patient whilst the cardiologist continues intervention.
- To collectively learn a protocol to allocate roles to the multidisciplinary team to lead delivery of tasks
- To learn risk stratification and preparation as a tool to head off complications at an early stage.

Previous candidate comments

Positive impact giving confidence to ensure WHO checklist is performed and better awareness of roles of others.

I will definitely be feeding back to cath lab team at my hospital and recommend it in the future.

We hope to change practice as a result of attending this course.

Being able to take part in emergency situations and apply the skills from workshops.
